## Customer Reviews

I was given the opportunity to review the book Our Solar System (Sun, Moons, & Planets) Second Grade Science Series 2nd Grade books. Here is my review: I liked the book, but there was not a lot of content. The book has a lot of illustrations which will help keep the kids attention. The book starts off with an explanation as to exactly what is included in our solar system. I liked how the book goes over some of the moons that orbit that other planets in our solar system. The illustrations are simply beautiful. As an adult I found myself staring at the pictures. The pictures opened up discussion about the solar system. The information next to the pictures went very well together. We found the information very interesting. I will say that I think the vocabulary in the book is a little much for a second grader, but as long as you help your child read the book it should be fine. I took it as an

opportunity to teach my kids some new vocabulary words. I asked my kids their favorite part of the book and was surprised how much each child remembered. My little one liked Mercury because it was the smallest planet. My daughter liked learning about Earth because that's where we live. My other son liked learning that Neptune is the furthest planet from the sun. I do wish that the book was a little longer. We all were enjoying the book, and just like that it was over. I would say that this book is a great place to start exploring our solar system. I received this product at a discount in exchange for my honest review. I would recommend this book to everyone with children. It is a great family book.

Instruct the students to memorize the names and positions of the planets. To make this easier, teach them a mnemonic device. Creating a silly sentence using the first letter of the planets that you are trying to remember is very helpful to children. For example "MY VERY EARTHLY MOTHER JUST SERVED US NEW PICKLES" helps students remember that the order of the planets. Discuss the different planets, and have your students develop a way of distinguishing the planets from each other. Use the key characteristics listed in the Background information. This book has pictures of the planets. This book helps just exposing the students to the different planets and emphasizing the need to compare and contrast their key characteristics. The seller, in exchange for an honest and unbiased review, supplied me with this product for free or discounted price. What you have read and watched is solely my very honest opinion based on my experience with this product. I only write honest reviews regardless of whether I purchased a product at full price, at a discount, or received it free. \*\*\*\*\* IF THIS REVIEW WAS HELPFUL PLEASE HELP OTHERS FIND IT BY CLICKING YES BELOW \*\*\*\*\*use

Great little book for my 2nd grader to hopefully get her interested in the Solar System. My 4th grader loves astrology so he enjoyed looking throughout this book as well. I was very pleased with the vivid pictures in the book when I pulled them up on my computer. I'm curious to see how these will look on my iPad too. There are short, easy to read paragraphs about the pictures. Because these are more of early reader books, they don't get into great detail. If you look at the "Look Inside" feature on , you can see the type of vivid pictures and paragraphs associated with each. There are many of these books in the "Baby Professor" series offered as ebooks for either free or 99 cents (at least when at the time I wrote this review.) I think there is actually about 200 of them! Most of the books seem to have about 32 pages. I'm hoping that I will be able to pull these books up on my iPad and read them with my kids (or better yet have them read them) at certain "down times" (waiting for the

other one to finish sports practice, waiting in a doctors office, etc.) I also have a friend with a 3 year old daughter who I entertain sometimes during these games and practices. I think she will really enjoy looking through the books and all the pictures. I did enjoy this book but would've disappointed if I had paid the full price for the paperback book. Overall very cool ebook. I received this e-book for free in exchange for my honest review.

This is the 3rd Baby Professor book that I have read. According to the title, this book is recommended for 2nd grade. I have a kindergartener and preschooler so my review is geared towards a slightly younger child. Overall, I found this book enjoyable and my children loved it. It covers a basic introduction for each of the planets in our solar system with a few extras about stars and moons of the planets. As with other books, there are concepts and words that are introduced that could use an explanation. For example use of the words terrestrial and magnetosphere without further explanation. The photographs that accompany the book are absolutely phenomenal and make the purchase worthwhile to me without the extra information. We were able to use this book to open the discussion for additional material about our solar system. Overall I would recommend this book for your young learner. I was provided this book for free in exchange for a fair and unbiased review

I am 6 & in 2nd grade homeschool. This book did not do a good job of explaining terms used like magnetosphere and satellite. A satellite can be man made and that is confusing. Also it didn't show how the solar system looks together or orbit our Sun. They talked about a few moons but didn't explain well about how there are so many moons when we study only one. I do not think this is a good book to learn about our solar system as a good picture for your mind.
